

THE COMPLETE LIBRARY · VOLUMES 1-3

THE 1,000 MEDICAL PROMPTS.

Clinician-grade AI prompts for medical students, interns and residents: thesis and publication, seminars and journal clubs, and study, exam and viva preparation, all built on one framework.

1000

Read this first.

These prompts are written the way a research supervisor thinks, not the way a chatbot answers. Many are long on purpose: a vague prompt gets you a vague, confident, wrong answer. Before you paste anything, five non-negotiables.

01 The AI does not know your patients.

Every prompt has a context block. Fill it honestly. If you say you have 200 cases a year when you have 40, the model will design a study you cannot finish.

02 Never accept a citation you have not opened.

Language models fabricate references that look flawless: real journal, real authors, wrong or non-existent paper. Verify every reference on PubMed by PMID or DOI before it enters your work.

03 Never paste identifiable patient data.

No names, hospital IDs, MRNs or scans with burned-in identifiers. De-identify before the data touches a chatbot. This is an ethics committee issue, not a preference.

04 The AI drafts. You decide.

Use it to speed up structure, phrasing and pre-checking. The scientific judgement, the assumptions and the interpretation stay yours. Your name goes on the paper, not the model's.

05 Declare AI use where required.

ICMJE and most journals require disclosure of generative AI use. AI cannot be an author. Check your journal's policy and your university's thesis rules before submission.

How to use each prompt

- › Copy the full prompt. The length is what makes the output specific.
- › Replace every [SQUARE BRACKET] with your real details. Options inside a bracket are separated by "/"; keep the one that applies.
- › Put anything you paste (abstracts, drafts, results) where the prompt shows [PASTE ...], above the task.
- › Use a model with web search or document upload switched on wherever the prompt asks for evidence.
- › Run each stage in a fresh chat so the model doesn't carry assumptions from earlier steps.
- › Push back. If the output is generic, reply: "Be more specific. Tie every point to my context."

Every prompt is built on **P-R-O-M-P-T**.

One formula, six layers. Each layer matches what OpenAI, Anthropic, Google and Microsoft recommend in their own prompting guides.

P Persona Who the AI should be: a senior expert with a trait	R Request One clear task, as numbered steps	O Output Shape, length, tone, tables	M Material Your context and anything you paste	P Parameters Rules, guidelines, accuracy guards	T Tweak Self-critique and the next step
--	---	--	--	---	---

See it in action

BAD	"Tell me about pneumonia."
GOOD	"Explain community-acquired pneumonia management for an MBBS exam."
BETTER	"Act as a pulmonologist. Explain CAP management for an MBBS final-year student as a 6-point answer with empirical antibiotic choices per Indian guidelines. Keep it under 150 words, exam-oriented."

Three kinds of prompt

QUICK 40–80 words One focused output in a few sentences. Each has a TRY IT WITH example.	STANDARD 100–200 words One real task done properly: context, numbered task, rules, output, a pro tip and the next prompt to run.	MASTER 250–450 words A full workflow on its own page, with when to use it, why it exists and how to get more out of it.
--	--	---

Tags you will see in the outputs

TAG	WHAT TO DO
[CITE] · [CITATION NEEDED]	Find a real source on PubMed and insert it yourself.
[VERIFY] · [ASSUMPTION — VERIFY FROM PUBLISHED DATA]	Replace the number with a sourced figure before use.
[UNVERIFIED BACKGROUND]	Treat as a lead to check, not a fact.
[ASK ME] · [NEED INFO] · [NOT REPORTED]	The model is missing information. Supply it, or leave it out.

Every prompt works in ChatGPT, Claude, Gemini and Copilot. → **NEXT** points to the prompt to run after this one.

What's in the library.

Vol 1 Thesis, Research & Publication

1.1	Topic selection & research question	#1–35
1.2	Literature search strategy	#36–65
1.3	Writing the Introduction	#66–95
1.4	Review of Literature	#96–135
1.5	Aims, objectives & hypotheses	#136–155
1.6	Study design & methodology	#156–195
1.7	Sample size & statistics	#196–240
1.8	Results, tables & figures	#241–265
1.9	Discussion, conclusion & limitations	#266–295
1.10	Protocol, ethics & synopsis	#296–315
1.11	Thesis to manuscript & publication	#316–350
1.12	Case reports & case series	#351–380
1.13	Conference abstracts, posters & oral papers	#381–400

Vol 2 Seminars, Journal Clubs & Presentations

2.1	Seminar preparation	#401–460
2.2	Journal club	#461–520
2.3	Slide design & structure	#521–560
2.4	Talks & oral presentations	#561–595
2.5	Posters & visual teaching aids	#596–630
2.6	Case presentations & grand rounds	#631–670
2.7	Delivery, Q&A & teaching	#671–700

Vol 3 Study, Exam & Viva Prep

3.1	Learning any topic	#701–750
3.2	Study planning & revision	#751–780
3.3	MCQ practice & exam strategy	#781–830

3.4	Long & short answer writing	#831–860
3.5	Viva, OSCE & practical exams	#861–910
3.6	Clinical reasoning & differential diagnosis	#911–970
3.7	Memory aids & high-yield summaries	#971–1000

HOW THIS EDITION WORKS

Each volume follows with its own cover, contents, prompts and index. Prompt numbers run 1–1000 across the whole library, and every → **NEXT** link points to a prompt in the same volume.
